QL Tutorial – How to install ostgreSQL and pgAdmin on Mac.

Spread the love

In this post, You will learn **how to install PostgreSQL and pgAdmin on Mac** operating system. pgAdmin is an administrative tool to manage your database, import and export data and write SQL queries.

Install PostgreSQL on Mac –

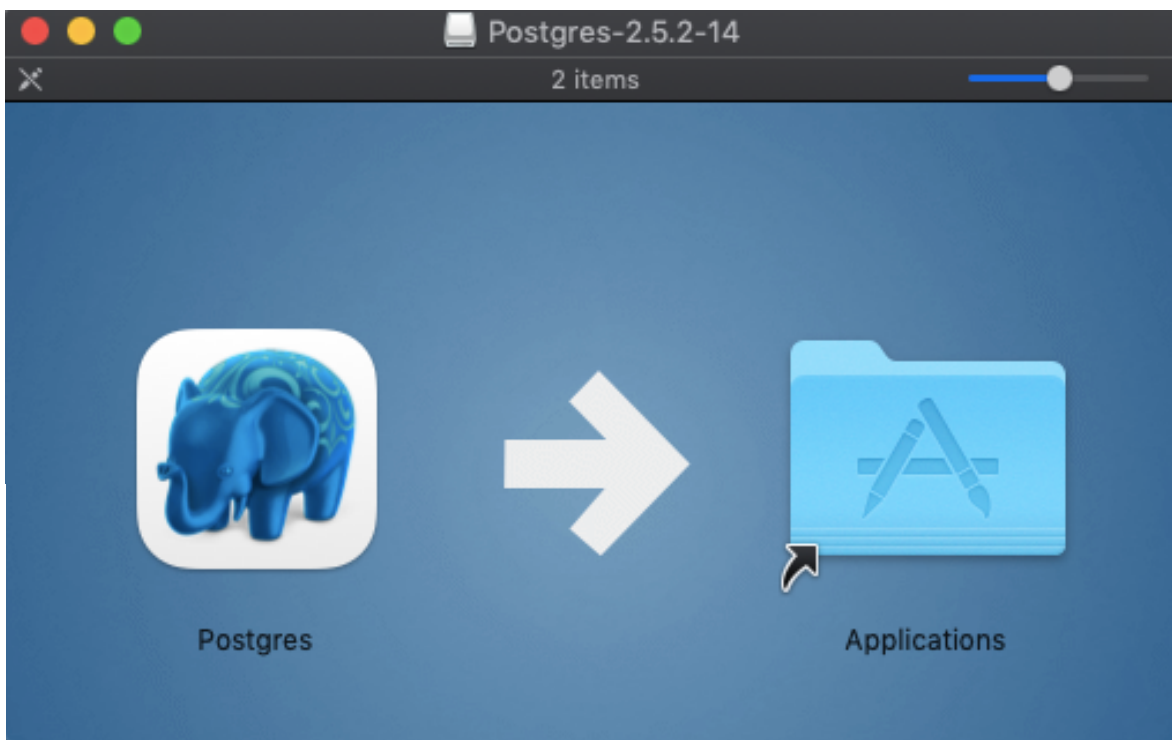

To installing PostgreSQL on Mac, we will use the Postgres.App. This is a open source Mac application for installing PostgreSQL and PostGIS extension for 3D data.

Visit the <https://postgresapp.com/downloads.html> and click on the **download** button to download the disk image file with .dmg extension.

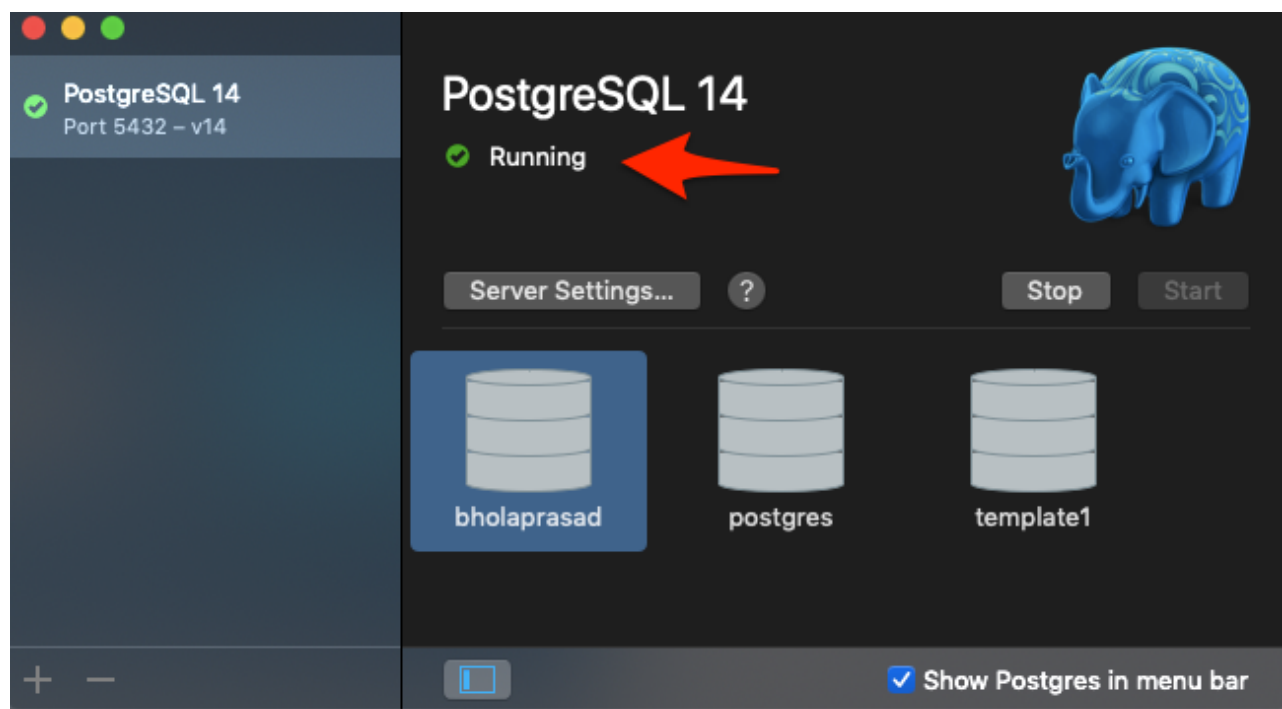

2. Double click on the .dmg file and **drag and drop** it into the Applications folder.

Now, Go to your Applications folder on Mac and Double click on the postgres icon to open it. Then click on **Initialize** to create and start the PostgreSQL database. You can also check the small elephant icon on the menu bar at top right to check if the database is running. By default postgresQL creates a database for you with the name **postgres**.

4. If you want to include **PostgreSQL command line** tools then run the following commands on your terminal. Copy the code as a single line and

paste it on the terminal and hit enter. You can also find the code from here – <https://postgresapp.com/>

```
sudo mkdir -p /etc/paths.d &&  
echo /Applications/Postgres.app/Contents/Versions/latest/bin | sudo  
tee /etc/paths.d/postgresapp
```

5. The default settings of the postgres database is this –

Host	localhost
Port	5432
User	<i>your system user name</i>
Database	<i>same as user</i>
Password	<i>none</i>
Connection URL	postgresql://localhost

Install pgAdmin on Mac –

Postgres.App does not include the **pgAdmin** tool. So you have to download it yourself.

1. Go to the **pgAdmin mac download** page – <https://www.pgadmin.org/download/pgadmin-4-macos/>
2. Select the **latest version** and on the next page click on the **pgadmin .dmg** file to **download**.
